Assignment 1. Baktiyarova Aruzhan SE-2533

TASK A - ANATOMY OF A REAL PAGE

Website studied: Bastible

page studied: Home page

1. **Basic HTML information**

DOSTYPE:

<!DOSTYPE html>

Language:

English(lang=”en”)

Charset:

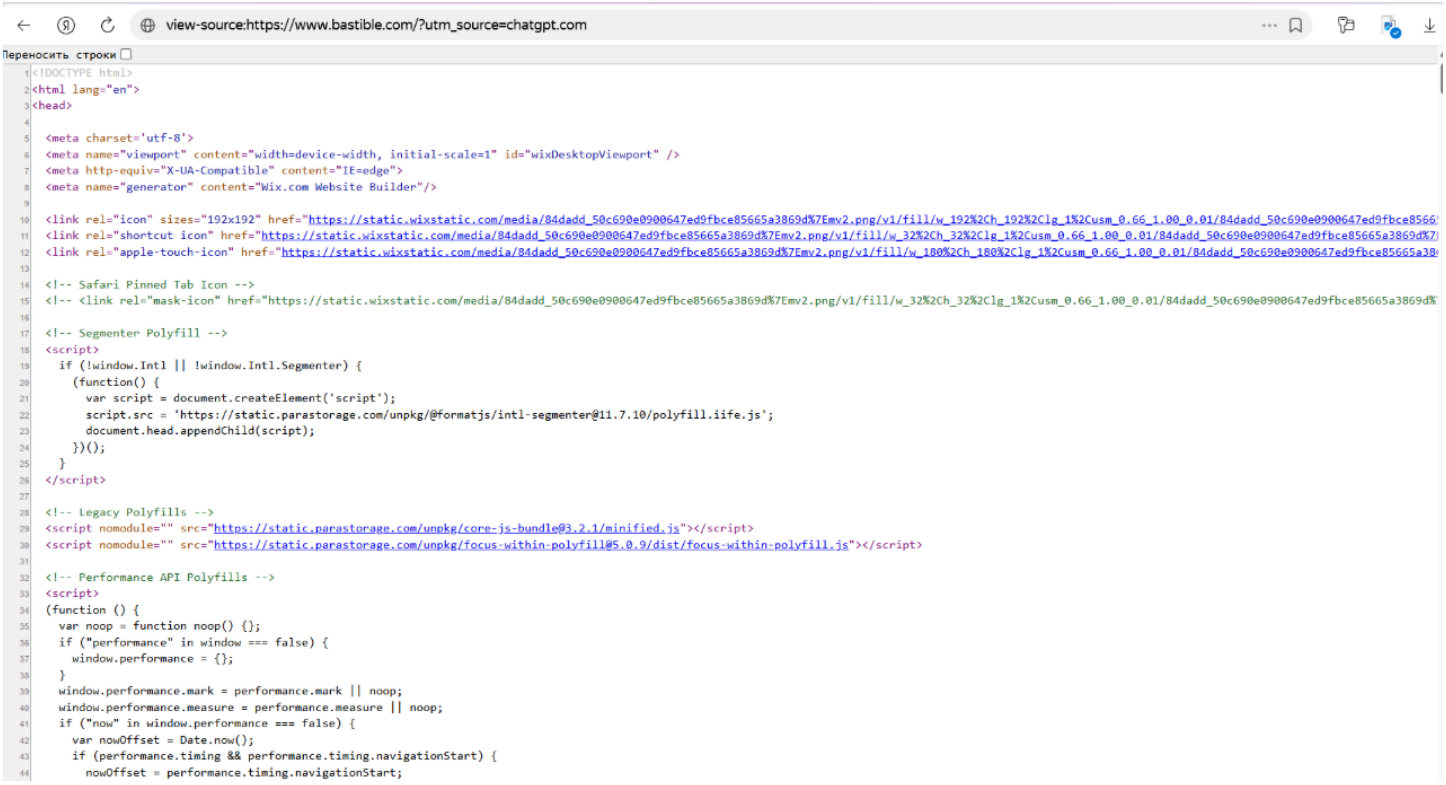

UTF-8

Viewport:

width=device-width,initial-scale=1

Title:

Restaurant | Bastible | Dublin

2. **Three Meta Tags**

1.Description

<meta name=”description content=”...”>

This meta tag provides a short description of the webpage.

2.Open Graph Title

<meta property=”og.title” content-”...”

This Meta Tag defines the title used when the page is shared on platforms that use Open Graph metadata

3.Open Graph Description

<meta property=”og.description” content=”...”>

This Meta Tag provides a description used for an Open Graph preview.

```

4. **Semantic HTML elements**

Tag	Purpose
<header>	contains the introductory/top part of the page
<nav>	Contains navigation links
<main>	Contains the main content of the page
<section>	groups related content
<footer>	Contains the bottom part of the page

i found several semantic HTML elements in the Bastible sourse code. The website uses <header> for the upper part of the page and <nav> for navigation. The main content is placed inside main,while <section> is used to group related content. The <footer> element is used for the bottom part of the page. These semantic elements make the structure of the document easier to understand because they describe the purpose of different parts of the page.

5. **Use of **

I also found many elements in the source code. There are 104 occurences of on the analysed page. They are mainly used as generic

containers for different parts of the Wix-generated structure. Unlike semantic elements,a does not describe the meaning of its content. Some elements are nested inside other containers, which makes parts of the source code more complicated to read.

6. **Forms and Tables**

i searched the source code of the Bastible home page for <form> and <table> elements,but did not find either of them. Therefore, there is no standart HTML form or table structure to analyse on the selected home page. In my own the Forest project, i use a table on the Menu page and reservation form on the Contact page.

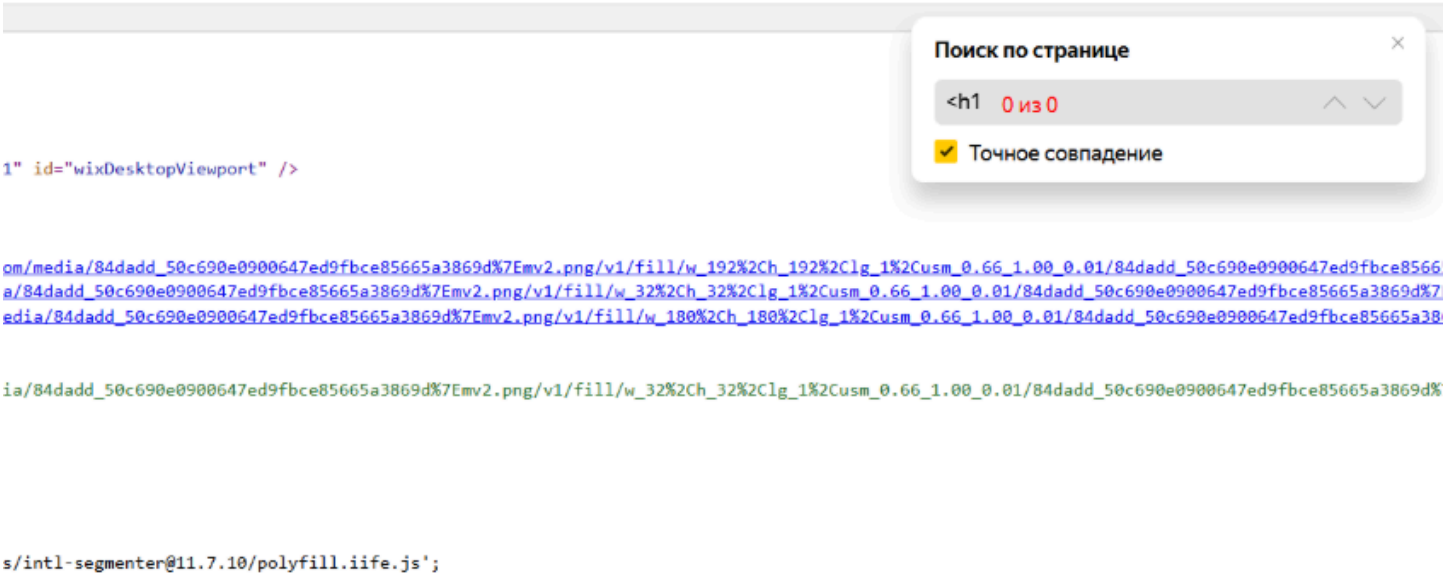

7.Three Structural Mistakes

mistake 1 - Missing <h1> Heading

while analysing the source code of the Bastible home and menu page, i did not find an <h1> element. However, i found two <h2> elements. This means that the page does not have a level-one heading that represents its main heading. A clear heading hierarchy makes the structure of a page easier to understand.

How i avoided it in my own project:

In my The Forestproject,i use exactly one <h1> element on each page. For example, the home page uses <h1>The Forest</h1> as its main heading. The other headings are placed below it using appropriate heading levels.

Mistake 2 - Excessive use of nested elements

I found 104 occurences of in the source code of the analysed Bastible page. Many of these elements are used as generic containers,and some of them are nested inside ither elements. Although is a valid HTML

element and is useful when a generic container is needed,excessive nesting can make the HTML structure more complicated and harder to read.

How i avoided it in my project:

in my The Forest project, i use semantic HTML elements whenever they correctly describe the purpose of the content. For example, i use <header> for the top part of the page, <nav> for navigation, <main> for the primary content,<section> for related content and <footer> for the borrom part. i avoid adding unnecessary containers.

Mistake 3 - empty alt attribute on a meaningful image

I found images with an empty alt attribute(alt="") in the source code. an empty alt attribute can be correct for a purely decorative image. However, if an image contains meaningful information,it should have descripttive alternative text. Otherwise, users who rely on assistive technologies may not understand the information provided by the image.

How i avoided it in my project:

In my The Forest project,i provided descriptive alt text for a meaningful photographs.

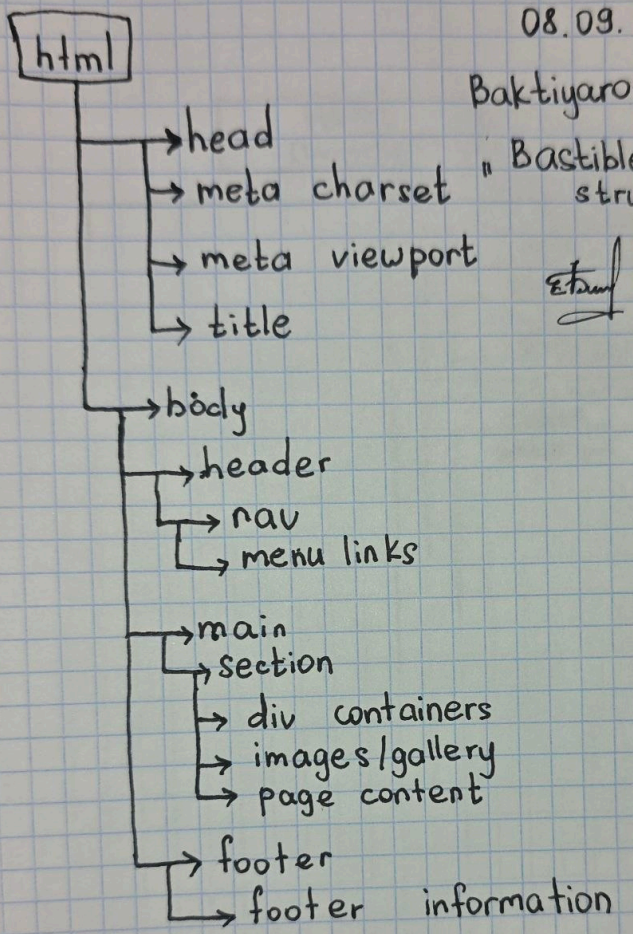

8.Hand-drawn page structure

I created a simplified hand-drawn representation of the structure of the Bastible home page. The drawing focuses on main structural elements of the page rather than every individual generated by Wix.

"Bastible Home Page structure"

Task B - How a web page works

A web page is basically an HTML document made of different elements. These elements help organize the content and tell the browser what each part of the page means. The <head> contains information about the page,such as title,character encoding,viewport and description. The <body> contains the content that users can see,including text,images,links,tables and forms.

When a browser opens an HTML file,it reads the HTML elements and uses their structure to display image. for example, <h1> represents the main heading,<p> represents a paragraph,<a> creates link.

In my The Forest project, i used semantic elements instead of using for every part of the page. I used <nav> for navigation between Home,Menu,Contact and Colophon. I used <main> for the main content and <footer> for the bottom part of the page. I chose these elements because they clearly describe the purpose of each part.

My contact page contains a reservation form with method=”post” and action=”#”. When user clicks cubmit, there is no backend to process the data,so the reservation is not acttually stored or sent to the restaurant.
